

746 EGG COUNTING

CONTINUOUS INSIGHT INTO EGG PRODUCTION

- Speed control egg belts
- Registration of feed and water consumption
- Electronic egg counters
- Connection to PC

746 EGG COUNTING

Fancom's 746 egg counting system doesn't just provide a reliable count of egg production; it also gives you insight into how production is progressing at any moment. Production differences per row caused by malfunctions or sickness show up immediately. An egg counting system can also help you identify at an early stage less than adequate ventilation or poor feed and water consumption which would otherwise have a negative impact on egg production.

Flow control

The 746 regulates the speed of the egg belts so that the supply on the collection belt is automatically and precisely geared to the packing capacity at all times. This gives huge time savings, and offers the added bonus of fewer start/stops, which considerably reduces the risk of cracked eggs and gives less wear and tear.

For every type of housing

The 746 is suitable for all types of housing system - aviary systems, cages or floor housing. Thanks to a faster readout and control, the 746 prevents any gaps in the flow of eggs caused by empty nesting boxes. With cage housing systems, the 746 ensures that all the houses are emptied simultaneously and takes a pre-set mix of eggs from different houses into account if required. Automatic lift control is also possible.

Registration of feed and water consumption

The 746 egg counting computer has unprecedented possibilities. 480 counters, divided over 8 groups or houses, can be connected to count eggs, but also to register feed and water consumption. The 746 egg counting computer registers production per

day, per group and per counter, in numbers and laying percentages. The computer displays this data for today, and for the past 7 days. The most important production data is displayed in weekly overviews and saved for 70 weeks.

Connection to your PC

The FarmManager™ management program generates a clear presentation of egg production data in graphs and tables. Any differences quickly become visible. Plus, the 746 egg counting computer can be remote operated and controlled. The management program can be extended using the special FarmManager for Layers™ analysis software that compares the key

performance indicators with the standards or with previous production cycles. This data is displayed in a clear dashboard.

Electronic egg counters

The counter is completely enclosed and therefore resistant to the aggressive conditions in a layer house, even when the houses are being sprayed clean. The counters use infrared technology to count the eggs without touching them. This prevents damage and soiling. Small counters are available for mounting on the egg belts and larger counters which can be mounted on the collection belt.
